Carbon monoxide is a potent pulmonary vasoconstrictor and arterial hypoxemia occurs in chronic carbon monoxide exposure (CCE). Oxidative stress is implicated in acute and chronic carbon monoxide induced cardiotoxicity. The aim of this study was to examine the effects of chronic exposure to carbon monoxide on oxidative stress in the rat heart. Male Fischer-344 rats (240-280 g) were exposed to 20 ppm of carbon monoxide for 8 h daily. Controls were exposed to air. Seven rats were euthanized at 5 days, one at 7 days and six at 14 days. Ventricular myocardium was collected and assayed for lipid peroxidation, catalase and superoxide dismutase activities. Myocardial mitochondria were isolated for the determination of calcium retention capacity (CRC) and creatine phosphate utilization (CPe). Significant increases in lipid peroxidation, catalase and superoxide dismutase activities were seen in the myocardium of the CCE group compared to the controls. In the mitochondria of the CCE group, catalase activity was higher and lipid peroxidation was significantly lower than in the controls.
