What's New in the TopSyS?

TopSyS is a tool aimed at providing multiple system information and hardware inventory. There's no native support for browser (like TopsySdo for Win2000), so you can't use it on Windows 98. How We Tested: It's a fairly simple tool to use, as it can be defined as a classic system information and hardware inventory tool. It's capable of collecting information about your computer, and most of the

time, it shows the same data you can find in Control Panel. We also liked the clean and easy-to-use layout, and the fact that it can scan, and show you data related to your entire system. The main issues with the software are that there's no way to edit any of the hardware entries (besides the ability to disable), and that you can't export any of the information you obtain.
